

Task 11

Copy

write a program which reads a file (file name is given as first parameter) and writes it to a different file (given as second parameter). This is a simple implementation of a copy program.

Usage

```
$ cp file1 file2
```

How to read commandline parameters

you have a argument count argc and the values as argv:

```
int main(int argc, char **argv)
```

you can check if you have two arguments with argc.

```
argv[1] // parameter 1  
argv[2] // parameter 2
```

Warning

test the parameter parsing with print statements. Otherwise you might create weird files ;)
